

VOC

PUBLIC BETA · VOCABRY.UZ

A PERSONAL MEMORY LAB

VOC learns how you forget.

A vocabulary app for Uzbek-speaking learners of English. It estimates, for every word, how likely you are to remember it — and tells you what to review today.

vocabry.uz

Learning a word does not mean you will remember it

Forgetting is not random — it is personal. Each learner loses different words at a different speed.

Day 1

Newly learned words feel fresh and easy to recall.

Day 3

Some words start to fade, and recall gets slower.

Day 7

Many words are gone unless they were reviewed.

The question VOC answers: which of *your* words are you about to forget?

A fixed schedule treats every learner the same

VOC replaces "review on day 1, 3, 7" with an estimate made for you, word by word.

	FIXED REVIEW SCHEDULE	VOC
When to review	Same intervals for everyone	Scheduled for you, word by word
What it learns from you	Right or wrong	Answer history, confidence, answer type (typed or chosen), number of reviews, overall accuracy
What you see	Whatever cards are due today	The words at risk of being forgotten
Result	Generic practice	Practice aimed at your weakest words

How VOC measures your memory

Signals from every answer go in. A simple status for each word comes out.

INPUT SIGNALS

Word history

Every past answer for this word

Answer speed

Confidence is estimated from it

Active recall

Typing the answer beats choosing it

Number of reviews

How often you have met the word

Overall accuracy

How well you do across all words

MEMORY MODEL

One estimate per word

How likely you are to remember it. Updated after every answer.

WHAT YOU SEE

A clear status

Strong

Weak · review today

At risk

How it works, and how accurate it is

1 · CHANCE OF REMEMBERING

A calibrated estimate from your history

Calibrated means the numbers match reality: of the words marked 70%, about 70% are remembered.

0.7
8

AUC on learners the model
never saw
random guess = 0.50

2 · WHEN TO REVIEW

A forgetting curve sets the schedule

Formula $P(t) = e^{(-t / S)}$ is used only to pick the next review date — not to judge what you know.

Early results from the public beta

40+

active learners in the beta

37,000+

real reviews analysed

24

learners in the test — 8
of them never seen by
the model

0.78

AUC on unseen learners
(random guess = 0.50)

What 0.78 means

Take one word a learner remembered and one they forgot. The model ranks them correctly 78% of the time. A coin flip gets 50%.

An honest note

Our first model did worse than a simple average. We measured it, found the cause and fixed it. Full story on our blog.

Limitation: small sample — early results.

How VOC learns you

Every answer is a signal. The more you use VOC, the better it knows your memory.

1 · YOU ANSWER

although

Speed 1.2 s

Answer type Typed

Confidence High (from speed)

2 · VOC UPDATES

Your memory model

Combines this answer with your full history for the word.

3 · RESULT

Strong

Same scheduling quality, different product

On scheduling we are on par with open-source FSRS-6. We don't claim to beat it — our edge is what we build around it.

	Anki	Duolingo	VOC
Built for	Self-directed learners who build their own decks	Casual learners on a set course	Uzbek speakers learning English, and their teachers
Review scheduling	FSRS (open source)	Own closed model	Calibrated model, on par with FSRS-6
What the learner sees	Cards plus detailed statistics	Lessons, streaks, points	A status for every word: "Weak · review today"
Teacher / centre panel	No	Duolingo for Schools	Yes: groups, homework, join by QR — our revenue (B2B2C)

Four parts, one memory model

Every answer makes both sides better

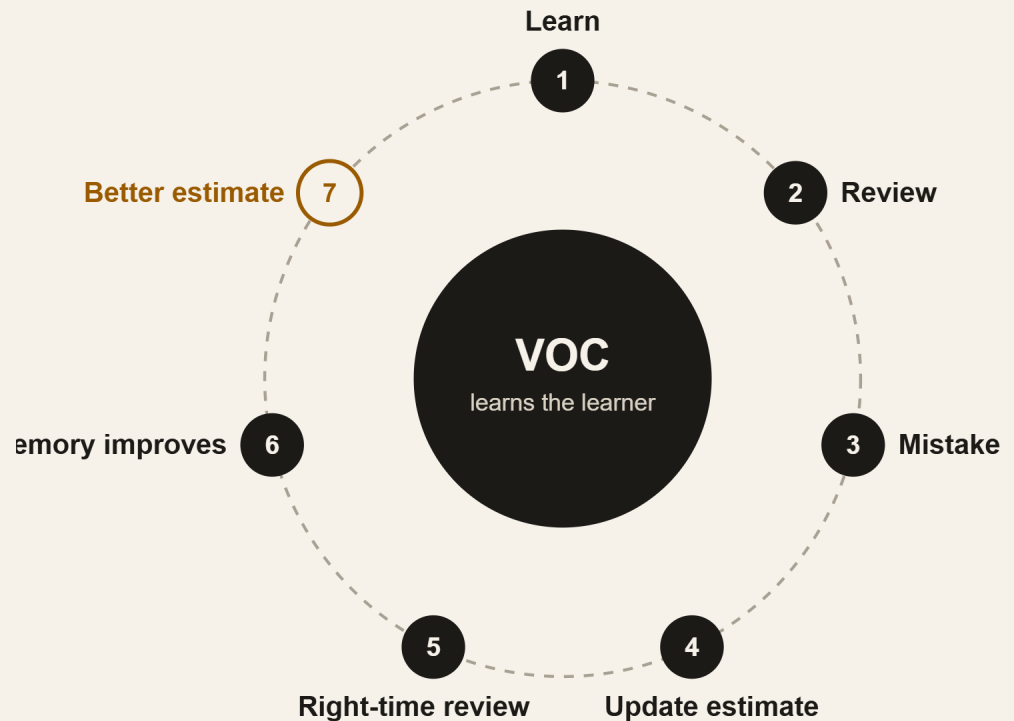

The learner improves

Steps 1–6: learn, review, make mistakes, and get each word back at the right time — so it sticks.

VOC improves

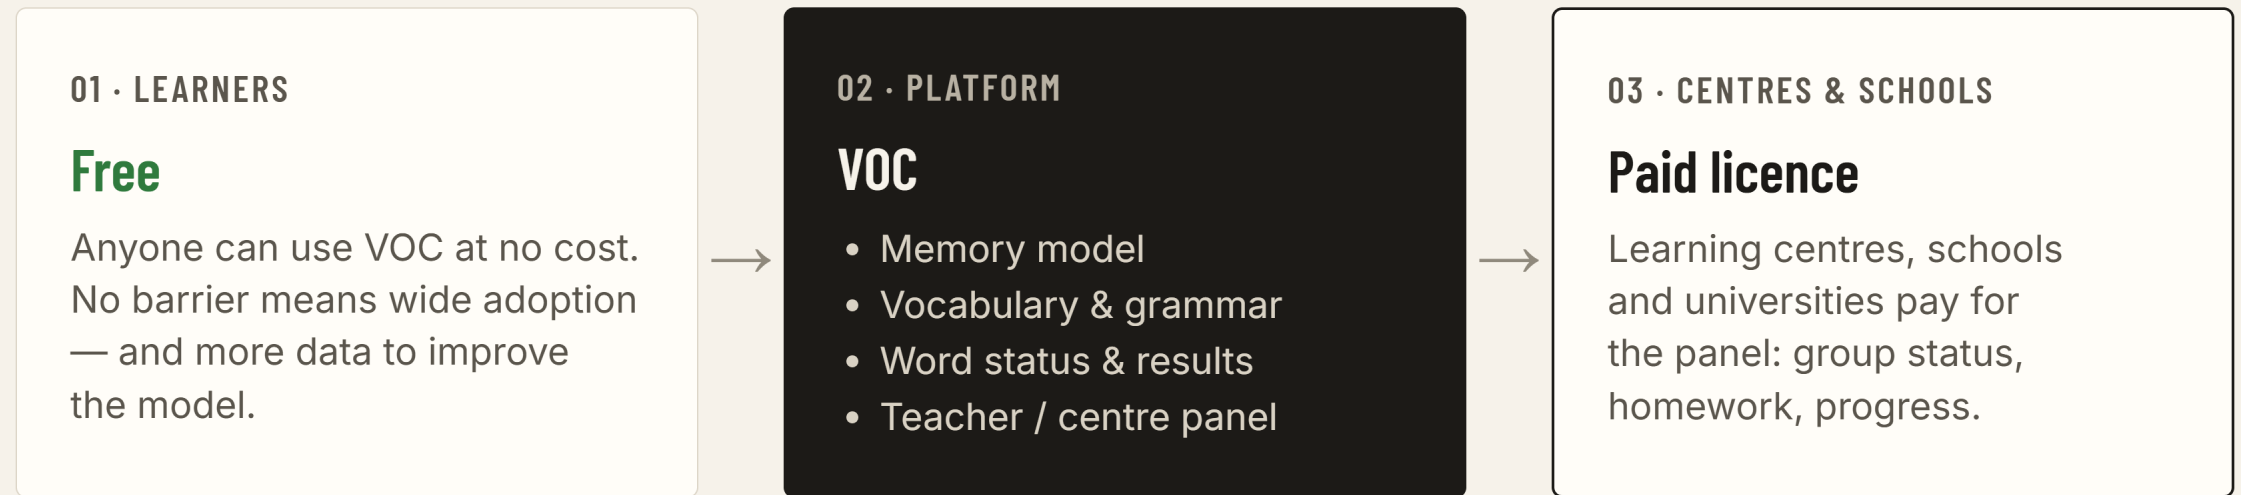

Step 7: every answer, including every mistake, makes the next estimate for this learner more accurate.

Every mistake teaches the learner.
Every answer teaches VOC.

Free for learners, paid by centres and schools

B2B2C: learning centres and schools pay; their students learn for free.

Start with learners, then sell to centres

Free learners prove the model works. Pilot results become the sales case for paid licences.

PHASE 1 · LEARNERS

Uzbek-speaking learners of English

Who: students at schools, universities and language courses.

How: free app, website, blog, joining through their teacher.

PHASE 2 · PILOTS

Free pilots at learning centres

Who: private language and exam-prep centres.

How: teachers use the group panel for a term; we measure retention.

PHASE 3 · PAID

Paid licences

Who: learning centres, schools, universities.

How: pilot results become case studies; licence per student or per centre.

What is working now, and what comes next

Low-cost, organic channels first. Paid ads only once we know what converts.

Where we are, and what comes next

NOW · LIVE

Public beta

v1.0.0-beta.1

- Calibrated memory model
- Teacher / centre panel
- Website and blog

NEXT

Prove and explain

the next two milestones

- Validate the review schedule on more learners
- Diagnosis: show why a word is forgotten

LATER

Personal memory model

the long-term vision

- How you learn and recover
- Learning paths built for you

Diagnosis: finding out why you forget

01

Detect

Notice a failed or very slow answer.

02

Diagnose

Rank the most likely reasons it was forgotten.

03

Intervene

Pick the practice that fixes that exact reason.

04

Re-estimate

Update the word's status and next review.

Today VOC shows *which* words are at risk. **Next, it will show why.**

A learner forgets "although"

LIKELY CAUSES

Estimated, not validated

Confused with a similar word 42%

Review gap too long 31%

Weak confidence history 18%

Too little exposure 9%

PLANNED FIX

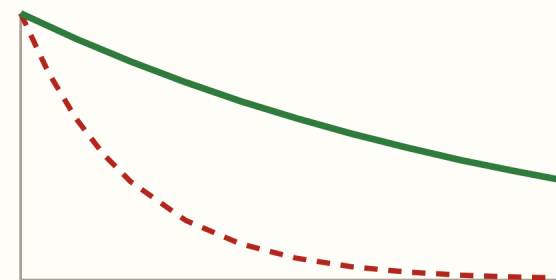

Contrastive drill

Practise "although" next to the word it gets mixed up with, until the difference is automatic.

He decided to go ___ the heavy rain.

despite ✓ + noun · **although** + clause

EXPECTED EFFECT

— After the drill: slower forgetting

- - - Before: slipping fast

What we don't know yet

Does the model hold at scale?

Results come from 24 learners. We need to confirm them on a much larger group.

Does the schedule help?

Not yet tested: does our review schedule improve long-term memory compared with a fixed one?

Will centres pay?

The panel is live, but price and pilot-to-paid conversion are not proven yet.

Will learners stay?

Beta users are active, but we have not yet measured retention over many months.

Will diagnosis change behaviour?

Showing why a word is forgotten must lead to better practice — still to be tested.

The people building VOC

Asadbek Abdukaxxarov

DESIGNER

UX/UI, visual design and design systems.

Xolmirzayev Azimjon

PRODUCT MANAGER

Product strategy, learning systems and roadmap.

Who we will hire next, in order

The model is built and measured. Next: prove it at scale, grow the product, and sell it.

01 · FIRST

ML / data engineer

Tests and improves the model on much more data.

Why: our results need a bigger sample.

02

Mobile / full-stack engineer

Ships the app and the teacher panel faster.

Why: from beta to a stable product.

03

Growth & partnerships lead

Runs pilots with centres and schools.

Why: turns pilots into paid licences.

04

Learning content lead

A linguist or teacher who designs word lists and drills.

Why: quality of what learners practise.

VOC – PERSONAL MEMORY LAB

Memory is personal.

VOC shows every learner which words they are about to forget.

Next, it will show why.
